NOTICE TO USERS

This Report reflects the thinking and design decisions, at the time of publication. Changes frequently occur during the evolution of the design process. Persons who may rely on the information contained in this document should consult with the Municipality of Anchorage, Project Management & Engineering Department for the most current design. Please contact Mr. John Smith, Project Manager at 343-8422 for this information.

1.0 TRAFFIC PROJECTIONS

The Spenard Road project started in 2000 as a Highway Safety Improvement Project (HSIP) to address pedestrian, bicycle, and motorist safety issues. The HSIP process included the development of two studies, the Traffic and Safety Analysis and Engineering Analysis Report. To address safety concerns, both studies recommended converting the current 4-lane section between Northern Lights Boulevard and Hillcrest Drive to a 3-lane section, one lane in each direction with a continuous two-way center left turn lane (CTWLTL). To reassess the HSIP recommendations and upgrade the road to current MOA arterial standards, new traffic projections are required.

1.1 DESIGN YEAR

For road reconstruction projects the design year is the initial construction year plus 20 years. The construction year for Spenard Road Phase II, Hillcrest Drive to Benson Boulevard, is anticipated to be 2017. Consequently, the design year and traffic projection will be for year 2037.

1.2 EXISTING FACILITIES

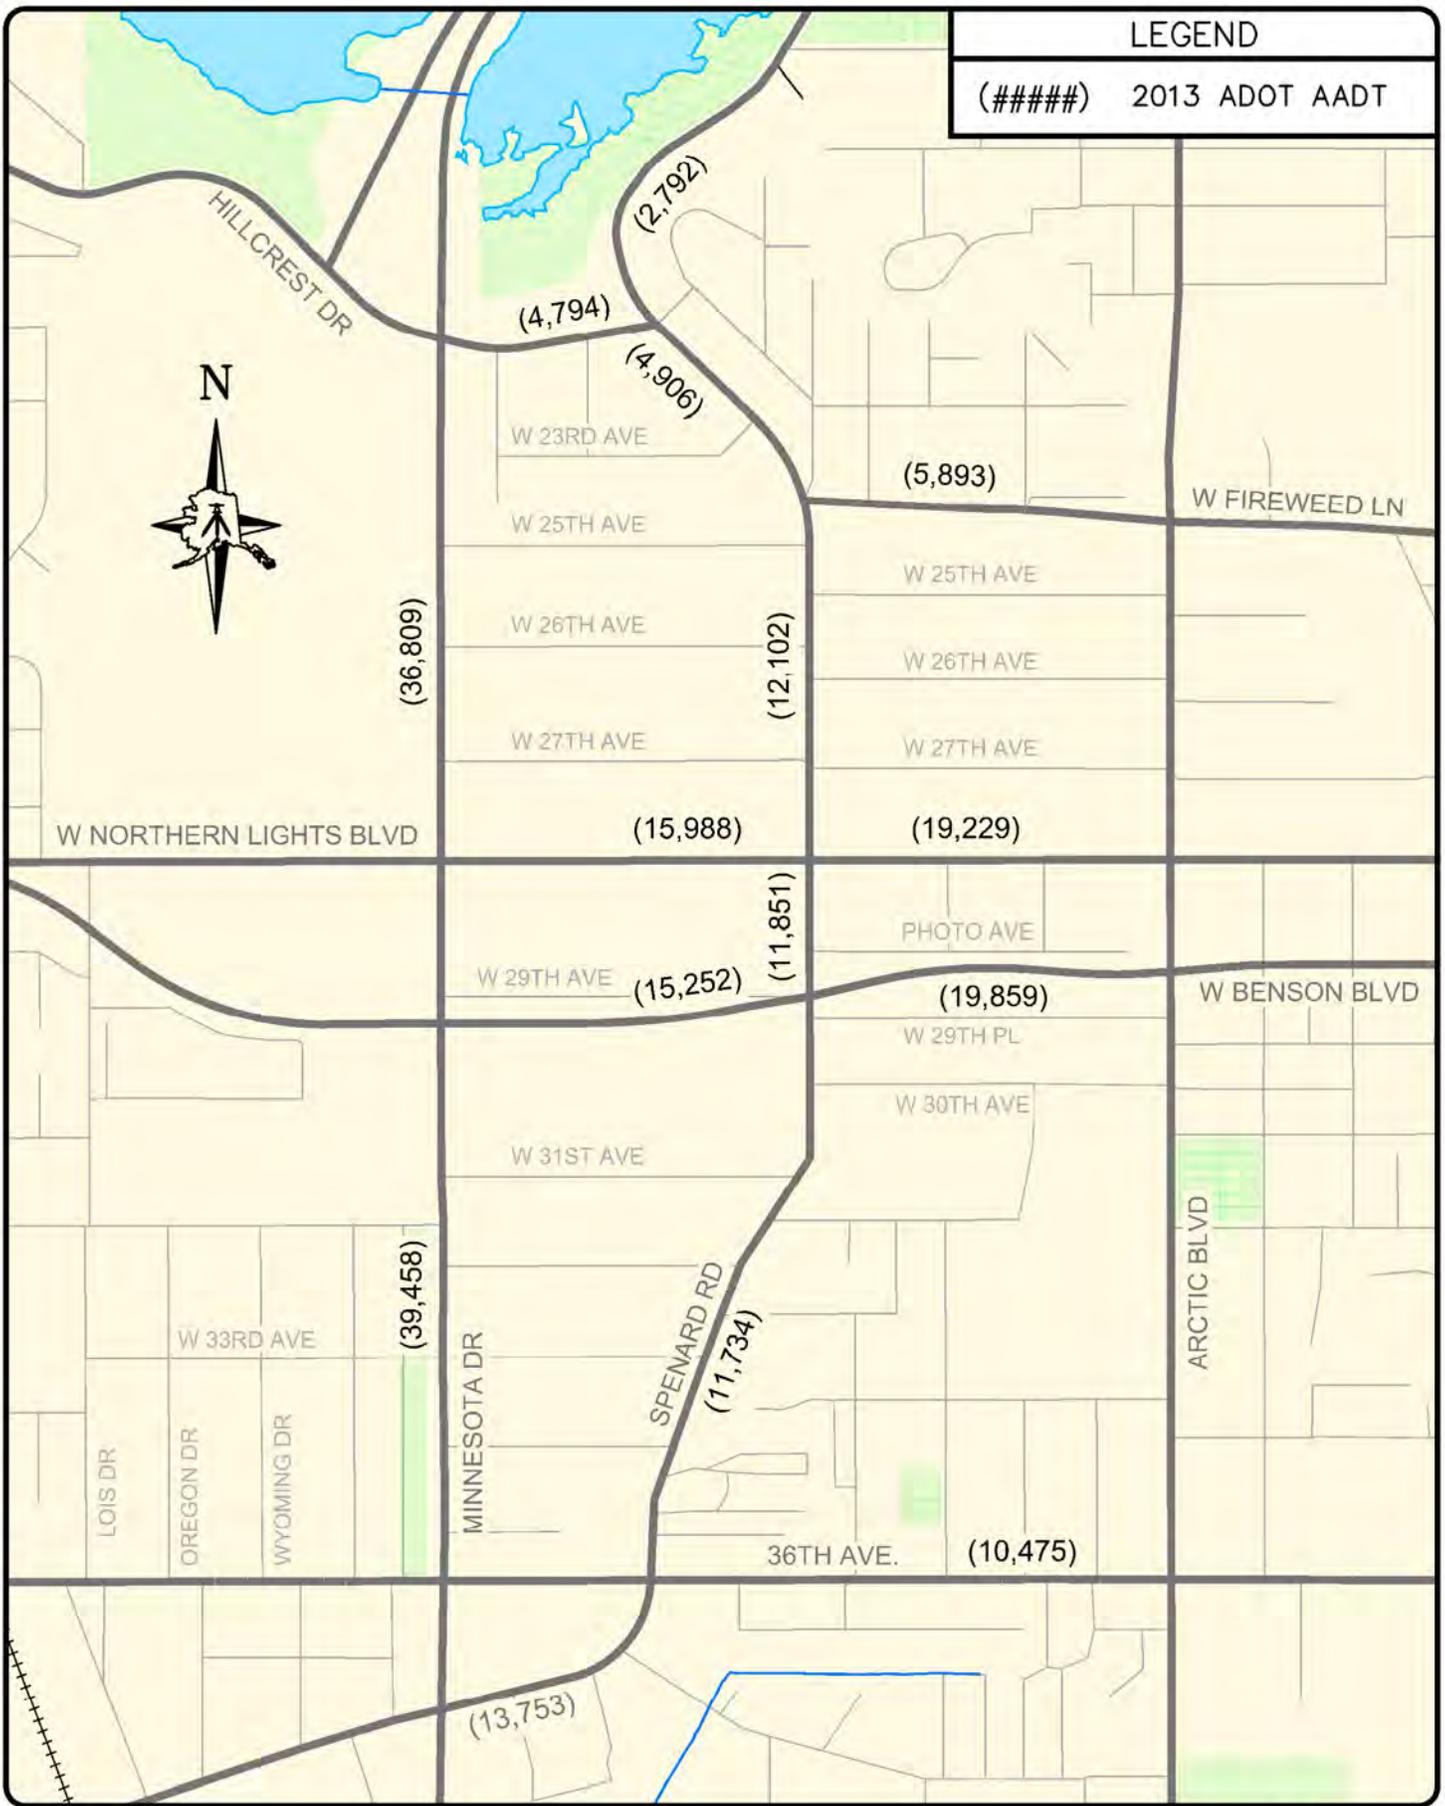

The Alaska Department of Transportation and Public Facilities (ADOT&PF) publishes the Annual Traffic Volume Report that includes Average Annual Daily Traffic (AADT) volumes for road throughout Alaska. AADT is the volume of traffic on a segment of road each day averaged over the entire year. Annual growth rates were determined from this data for individual road segments for 5-, 10-, and 20-year time frames. Figure 1 shows the 2013 published AADT volumes for Spenard Road.

Future AADT projections were based on an analysis of past historical growth patterns of Spenard Road and the Anchorage Metropolitan Transportation Solutions (AMATS) 2035 transportation model projections.

1.3 FUTURE TRAFFIC VOLUMES

The current MOA project area extends from Benson Boulevard to Hillcrest Drive. To assist in the projection analysis, Spenard Road project corridor was divided into four segments to best represent current traffic patterns. The road segments are bound by the major signalized intersections of Benson Boulevard, Northern Lights Boulevard, and Fireweed Lane. The traffic projection assessments were developed for the following segments:

- 36th Avenue to Benson Boulevard;
- Benson Boulevard to Northern Lights Boulevard;
- Northern Lights Boulevard to Fireweed Lane; and
- Fireweed Lane to Hillcrest Drive.

Future Traffic Volumes

Twenty years of historic AADT data was used to develop the historic annual growth rates for Spenard Road. Data used in determining past historical growth rates was obtained from published ADOT&PF Central Region Traffic Volume Reports. Published reports can be found on ADOT&PF’s website at http://www.dot.alaska.gov/stwdp/ing/transdata/traffic_reports.shtml. The reports are a compilation of traffic data collected, reviewed and analyzed by the Highway Data Section of ADOT&PF and approved by the Federal Highways Administration.

Historic growth rates for three time periods were developed, 1993-2013 (long-term), 2003-2013 (mid-term) and 2008-2013 (short-term) for each road segment. From this data, 20-, 10-, and 5-year growth trend overviews were developed. The historic annual growth rate is estimated by using the beginning year AADT and ending year AADT for each of the three time periods. Table 1 provides the historic annual growth rates during the three time periods for each segment.

Table 1 - Spenard Road Historic Annual Growth Rates

Year	Segment				Average
	36 th Ave to Benson	Benson to NLB	NLB to Fireweed	Fireweed to Hillcrest	
2008-2013	-0.30%	-1.55%	1.23%	-4.62%	-1.31%
2003-2013	-1.52%	-1.70%	-1.16%	-4.60%	-2.25%
1993-2013	-0.77%	-1.10%	-0.80%	-0.90%	-0.89%
<i>Average</i>	-0.86%	-1.45%	-0.24%	-3.37%	

Growth rates based on linear trend lines of historic AADT were also developed for the same time periods and road segments. Linear trend lines provide a means to determine the statistical confidence in the underlying data. Table 2 provides the linear annual growth rates during the three time periods for each segment.

Table 2 - Spenard Road Trend Line Growth Rates

Year	Segment				Average
	36 th Ave to Benson	Benson to NLB	NLB to Fireweed	Fireweed to Hillcrest	
2008-2013	0.05%	-3.95%	1.30%	-3.33%	-1.48%
2003-2013	-1.59%	-1.59%	-1.91%	-3.56%	-2.16%
1993-2013	-1.13%	-1.12%	-0.96%	-0.30%	-0.88%
<i>Average</i>	-0.89%	-2.22%	-0.52%	-2.40%	

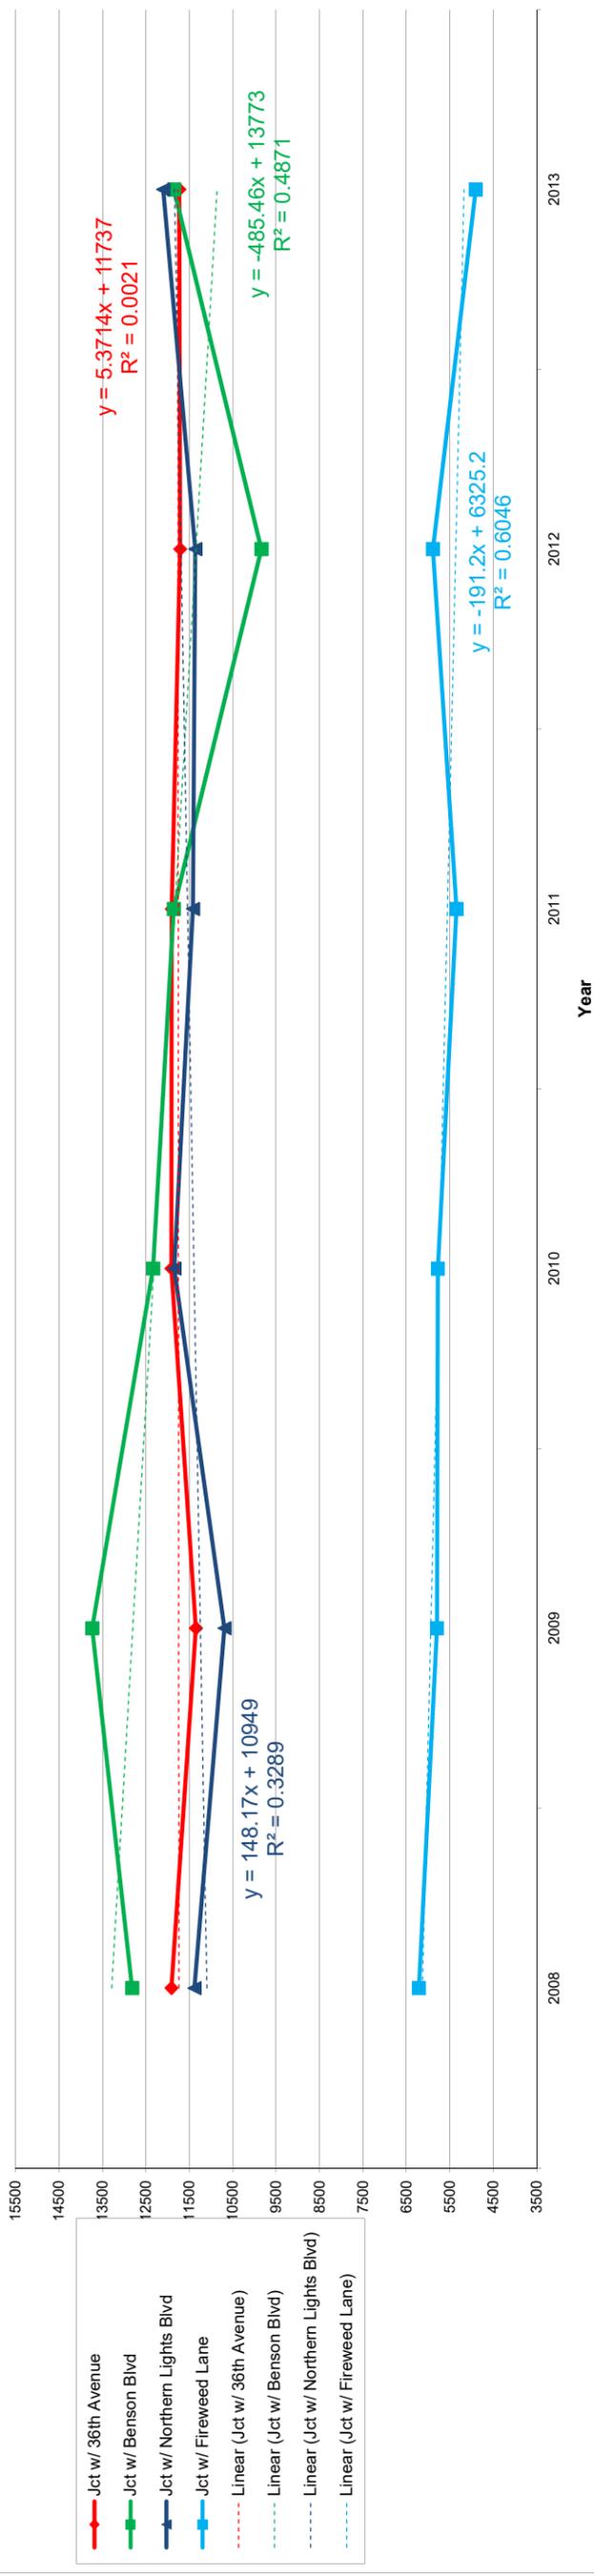

Figures 2 through 4 show the graphical representation of the historic traffic trends over 5-, 10-, and 20-year periods

LINEAR TREND LINE ANALYSIS: A linear trend line analysis attempts to find a linear relationship among a given set of data. The equations given on this sheet are for the line that most closely fits the data. The R² factor indicates how well the line correlates to the data. As the R² value approaches 1, the relationship between the best fit line and the data becomes stronger. Growth rates are calculated from the results of the best fit line.

HISTORICAL ANALYSIS: The historical analysis evaluates the change in data between two specified years. An annual compound growth rate calculation is applied to determine the growth rate from one year to another.

THIS SHEET PROVIDES A BASIS OF COMPARISON BETWEEN GROWTH RATES CALCULATED BY A LINEAR TREND LINE ANALYSIS AND GROWTH RATES CALCULATED FROM THE BEGINNING AND ENDING YEARS' DATA. A GRAPHICAL REPRESENTATION OF THE TWO GROWTH RATE CALCULATIONS IS SHOWN IN THE GRAPH. GENERAL OBSERVATIONS REGARDING THE TWO ANALYSIS METHODS ARE GIVEN BELOW.

LINEAR TREND LINE ANALYSIS: A linear trend line analysis attempts to find a linear relationship among a given set of data. The equations given on this sheet are for the line that most closely fits the data. The R² factor indicates how well the line correlates to the data. As the R² value approaches 1, the relationship between the best fit line and the data becomes stronger. Growth rates are calculated from the results of the best fit line.

HISTORICAL ANALYSIS: The historical analysis evaluates the change in data between two specified years. An annual compound growth rate calculation is applied to determine the growth rate from one year to another.

THIS SHEET PROVIDES A BASIS OF COMPARISON BETWEEN GROWTH RATES CALCULATED BY A LINEAR TREND LINE ANALYSIS AND GROWTH RATES CALCULATED FROM THE BEGINNING AND ENDING YEARS' DATA. A GRAPHICAL REPRESENTATION OF THE TWO GROWTH RATE CALCULATIONS IS SHOWN IN THE GRAPH. GENERAL OBSERVATIONS REGARDING THE TWO ANALYSIS METHODS ARE GIVEN BELOW.

Figure 7

Spenard Road Corridor Discussion

The historic 10- to 20-year growth patterns and future AMATS forecasts are negative for all segments of the roadway within the project corridor. However, in the past 5 years, the Northern Light Boulevard to Fireweed Lane segment has seen a positive 1.2% growth rate. Even with generally negative growth trends, it appears the area is beginning to witness revitalization through renovation of businesses such as REI, Northern Lights Center, Bear's Tooth, Chilkoot Charlies, and Bosco's, to name a few. The *Spenard Corridor Technical Report* dated April 2011 also recognizes this renewal potential by identifying several development catalyst zones, or areas whose existing conditions and/or location is catalytic for future investments and revitalization.

In fact, MOA's investment in Spenard Road must consider anticipated future growth and development in the area during the design life of the project. While traffic trends are generally decreasing, urban street design should attempt to balance the needs and goals of multiple corridor users. These user groups are typically motorists, bicyclists, and pedestrians. Different user groups generally have different goals that many times are in conflict with one another. The proposed 3-lane road section provides a balance that should provide a more user-friendly environment for the stakeholder groups.

Numerous studies have been developed that demonstrate conversion of 4-lane undivided to 3-lane roads with CTWLTLs have both operational and safety benefits. These benefits support motorist and non-motorist alike. However, the conversion benefits can only be realized if future traffic remains below recommended volume thresholds. According to the Federal Highways Administration's *Road Diet Informational Guide*, the recommended upper limit AADT for 3-lane roadways is 20,000 vpd. To exceed this threshold, Spenard Road would need to experience an approximate 2.5% growth rate over the next 20 years.

Anecdotal evidence exists that illustrates higher volume 3-lane road sections can performance well in Anchorage.

Table 6 - AADT of 3 Lane Roads in Anchorage

3-Lane Section	2013 AADT
Mt. View Dr. – Bragaw to Pine	10,740
Arctic Blvd. – Tudor to International	10,617
Arctic Blvd. – Benson to 36 th	11,200
15 th Ave. – C St to Cordova	11,454
Spenard Rd. – Wisconsin to Northwood	13,193
Spenard Rd. – Northwood to Woodland	16,070

2.0 TRAFFIC PROJECTION RECOMMENDATIONS

The project area is predicted to have modest growth through the 20-year design life with the Northern Light Boulevard to Fireweed Lane section of Spenard Road experiencing the greatest growth. Growth along this segment is anticipated to remain at 1%. The remaining segments of Spenard Road and adjoining cross streets are forecasted to grow at 0.5%. A 0.5% growth rate produces design year (2037) traffic volumes that correspond to historic volumes similar to those in early to mid-2000's. The following tables summarize the recommended growth rates and AADT projections for the project.

Table 7 - Spenard Road Growth Rates and Traffic Projections

Segment	Growth Rate	Construction 2017	Mid-Year 2027	Design Year 2037
30 th Ave to Benson	0.5%	11,970	12,590	13,230
Benson to NLB	0.5%	12,090	12,710	13,360
NLB to Fireweed	1.0%	12,600	13,920	15,370
Fireweed to Hillcrest	0.5%	5,010	5,270	5,530

Table 8 - Major Cross Street Growth Rates and Traffic Projections

Segment	Growth Rate	Construction 2017	Mid-Year 2027	Design Year 2037
Benson: Minnesota to Spenard	0.5%	15,560	16,360	17,200
NLB: Arctic to Spenard	0.5%	19,620	20,620	21,680
Fireweed: Arctic to Spenard	0.5%	6,020	6,320	6,650
